Interaction Design:

- The book shelf doubles as a navigation bar for the web application , each book that appears has its own file destination.
- When hovered over each book will change colour to let the customer know they can click to navigate to a different page.
- Only certain books will appear depending on the status of the user - ie if the user is logged in, they won't see book navigations for log in or register only log out. , vise versa

if they are not logged in they won't see book navigation items for your reviews or edit review or log out.

- There are clear buttons on all pages that direct to a specific action.
- The homepage has instructions on what the site does and then buttons to either sign in or register.
- The registration form is a simple 2 section form - username and password, once completed click the register button which will create and store the profile in the database and redirect users to their "your reviews section" which they now have access to.
- The login page has a similar set up , two item form and click log in to be directed to "your reviews"
- From here they can add a review using the "add review" nav link.
- This has a clear form format for adding there review and once complete, click submit to add there review to the database , they will be redirected to "your reviews with flash message confirming review has been successfully added.
- They can then click edit to edit there review , complete the form again and once sent , they will be redirected to there account with flash message "review successfully edited".
- To delete a review they simply click the delete button, once clicked they will be redirected to their reviews with flash "review deleted".
- Once finished with the site then click log out , they will be redirected to the main homepage with a flash message you have logged out.
